phates, Silicates, Borates, Crystals, *Absorption
spectra.

The influence of glass composition, melting conditions
and Ce-concentration on the absorption spectra, fluores-
cence and phosphorescence of Ce-glasses was studied.
Specially pure raw materials were used in the batch.
The absorption was measured on test pieces 0.1-0.5 mm

Organic derivatives of silica were prepared by treating silica with triphenyl- and trimethylchlorosilane or with hexamethyldisilazane. The trimethylsiloxy derivatives are extremely hydrophobic. Butyl derivatives were prepared by treatment of silica chloride with butyl magnesium bromide or with butyl lithium, and phenyl derivatives were prepared with benzene in the presence of aluminum chloride or with phenyl lithium. Phenyl derivatives of silica prepared with phenyl lithium were degraded by sodium hydroxide. The toluene-soluble degradation products were fractionated on an aluminum oxide column. One degradation product was identified as $(C_6H_5SiO_{1.5})_x$. The (Chemistry--Organic, TT, v. 5, no. 12) (over)
